

Email from John Cribbes to Cameron Stewart (The Australian)

Get your bathers on for sea level hoax.

Dear Cameron,

Please excuse this email from an old bloke who is getting very (to put it very politely, in deference to your ears) pissed off by Government pronouncements regarding sea level rises.

I don't doubt that their computers, loaded with flawed programs, show a rise in sea levels within the next decade but as a 72 year old codger I remember the saying when computers first arrived in our works and homes. GIGO. Garbage In Garbage Out.

There is now a lot of peer reviewed science that tells us that. Over the past century there has been very little sea level rise, certainly not enough to warrant any action.

I have found the Galileo Movement web site's library very convenient.

If you were to key in sea level rise or Prof Bob Carter or Dr Vincent Gray you will find many peer reviewed papers that tell me that because of the lack of sea level rise since 1900 there is very little worry about sea level rise over the next century.

If you would like a nice topic that will send the climate alarmists frantic, have a look at the work of Donna Laframboise, a Canadian researcher who has found that 30% of the supposed peer reviewed papers in the IPCC's 2007 AR4 Report are nothing to do with peer review, being press releases by such organisations as Greenpeace and WWF.

Dr Joe D'Aleo and Anthony Watts are two meteorologists who have investigated the raw data for world temperatures and found a lot of unexplained manipulation. The weather stations right up near the North Pole – as well as those at high altitude – were not used in favour of more weather stations nearer the Equator. Result? You guessed it, the globe is warming up and here is proof.

A lot of Australians think that Weather Scientists are always very accurate, would never tell porkies. Have a look at the USA Congress investigation. At http://epw.senate.gov/public/index.cfm?FuseAction=Files.View&FileStore_id=7db3fbd8-f1b4-4fdf-bd15-12b7df1a0b63

The Galileo Movement library has many articles that ought to interest you.

Sincerely, John Cribbes
